## **Revision History**

<b>Revision Date</b>	<b>Previous Revision Date</b>	<b>Summary of Changes</b>	<b>Changes Marked</b>
		First Issue	Mohamad Nor Hassan
		Second Issue	Dr Rabiei Mamat Dr Faizah Aplop Dr Fouad Ts Dr Rosmayati Mohemad Fakhrul Adli Mohd Zaki
21/02/2019		Addition of Revision History, Table of Contents, Formatting Cover Page	Fakhrul Adli Mohd Zaki

## Table of Contents

<b>Task 1:</b> Passing Data from Main JSP's Page to Other JSP's Page .....	5
<b>Task 2:</b> Using Mathematics operations in JSP .....	10
<b>Task 3:</b> Populate an Array Values into HTML's Table .....	14
<b>Task 4:</b> Perform Calculation of Car Loan .....	16
<b>Task 5:</b> Using JSP Page Directive to Call Java API .....	19
<b>Task 6:</b> Use JSP Include directive for JSP Page .....	25

**Arahan:**

Manual makmal ini adalah untuk kegunaan pelajar-pelajar Pusat Pengajian Informatik dan Matematik Gunaan (PPIMG), Universiti Malaysia Terengganu (UMT) sahaja. Tidak dibenarkan mencetak dan mengedar manual ini tanpa kebenaran rasmi daripada penulis.

Sila ikuti langkah demi langkah sebagaimana yang dinyatakan di dalam manual. Tandakan (/) setiap langkah yang telah selesai dibuat dan tulis kesimpulan bagi setiap aktiviti yang telah selesai dijalankan.

**Instruction:**

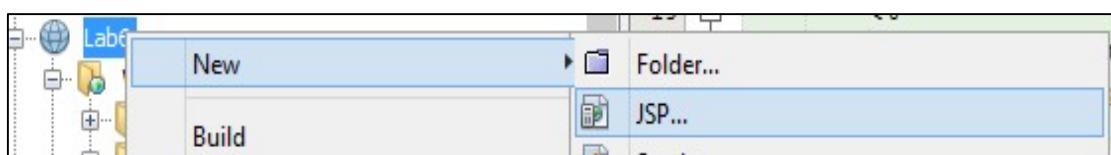

*This laboratory manual is for use by the students of the School of Informatics and Applied Mathematics (PPIMG), Universiti Malaysia Terengganu (UMT) only. It is not permissible to print and distribute this manual without the official authorisation of the author.*

*Please follow step by step as described in the manual. Tick (/) each step completed and write the conclusions for each completed activity.*

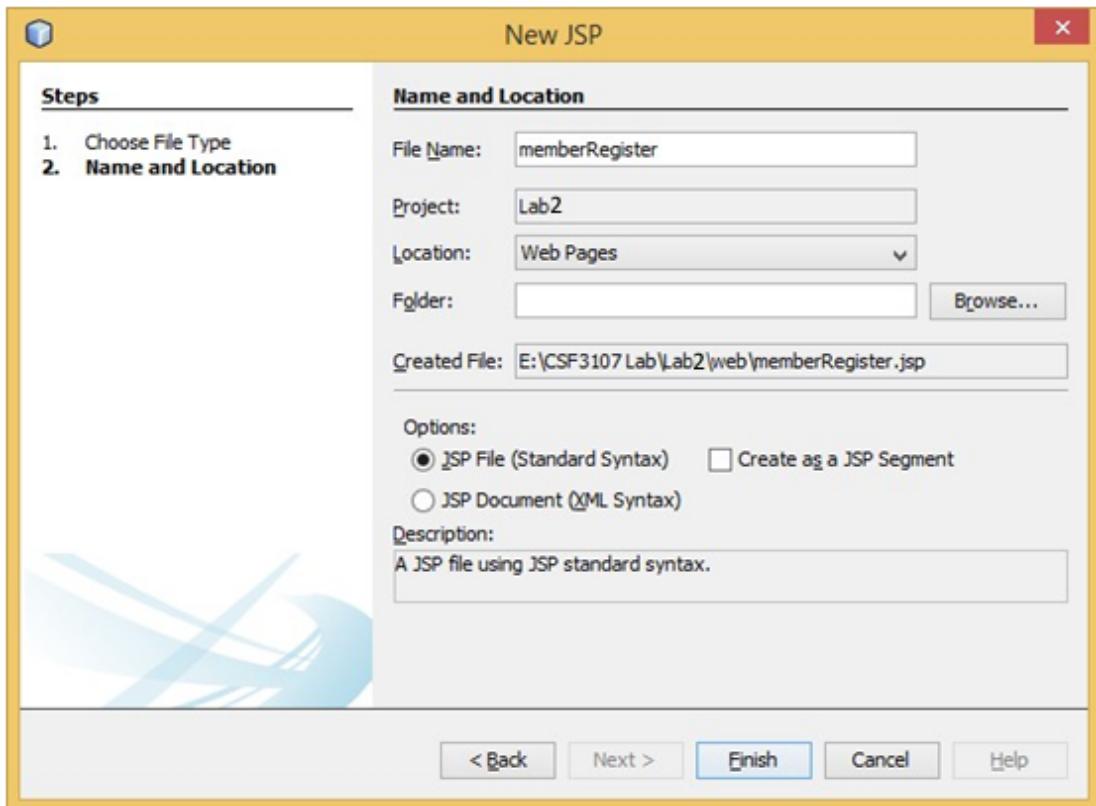

## Task 1: Passing Data from Main JSP's Page to Other JSP's Page

<b>Objective</b>	: To demonstrate the use of <code>request.getParameter</code> (“ <code>fieldName</code> ”) for passing input from one JSP’s page to another JSP’s page.
<b>Problem</b>	: i. Create a page <code>memberRegister.jsp</code> .
<b>Description</b>	ii. Page <code>memberRegister.jsp</code> consists of two (2) inputs; <ul style="list-style-type: none"><li>• IC No (Must be in pre-formatted XXXXXXXXXX)</li><li>• Name</li></ul> 3. In <code>memberRegister.jsp</code> , include two (2) buttons; <i>Submit</i> and <i>Cancel</i> button. 4. Create a page <code>memberProcessing.jsp</code> . 5. When user click <i>Submit</i> button, process the request and display the input key-in in <code>memberProcessing.jsp</code> page.
<b>Estimated time</b>	: 30 minutes

1. Create new Project namely *Lab2*.
2. To create a JSP’s page, right click *Lab2* -> *New* -> *JSP*.

3. Key-in File Name: *memberRegister*.

4. Click *Finish* button.

5. Source code for *memberRegister.jsp* will appear.

6. Write a HTML's markup to produce HTML's form

```
<body>
    <h1>Passing data from main JSP's page to other JSP's page </h1>
    <form id="memberFrm" action="memberProcessing.jsp" method="post" onsubmit="return checkICNo()">
        <fieldset>
            <legend>Member Registration</legend>
            <label for="invoiceno">Ic No *</label>
            <input type="text" id="icno" name="my_icno" size="15" placeholder="E.g. 921012101245"><br/>

            <label for="name">Name</label>
            <input type="text" id="name" name="my_name" size="45" placeholder="Key-in your name"><br/>

            <p><input type="submit" id="btnSubmit" value="Submit"/>
                <input type="reset" id="btnCancel" value="Cancel"/>
            </p>
        </fieldset>
    </form>
</body>
```

7. Save and compile *memberRegister.jsp* file.
8. Run the *memberRegister.jsp* file and you should get the interface as below:

9. Repeat step 1 and step 2.
10. Key-in File Name: *memberProcessing*.
11. Click *Finish* button.
12. Source code for *memberProcessing.jsp* will appear.
13. Write a HTML code.

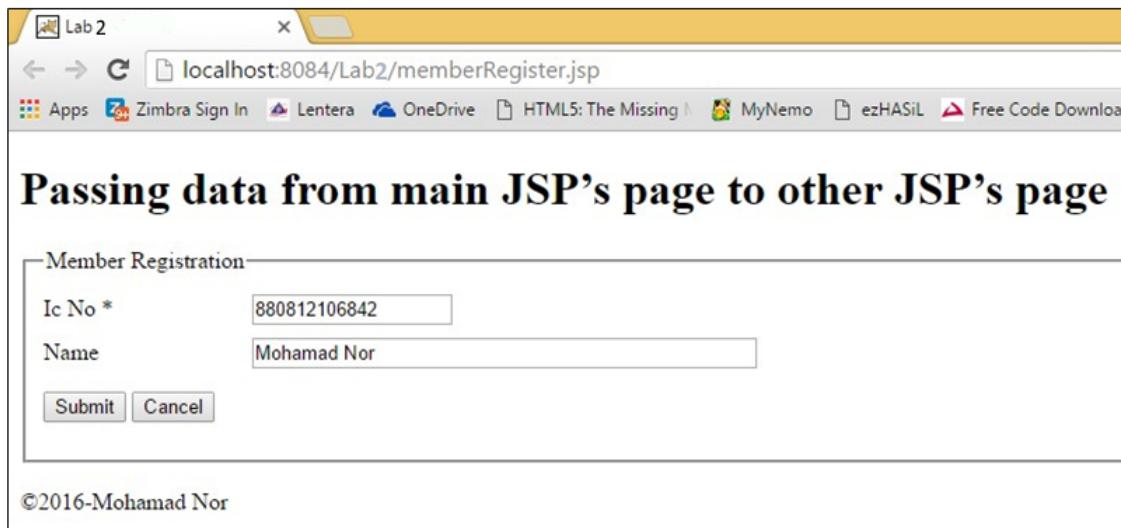

```
8   <!DOCTYPE html>
9   <html>
10  <head>
11    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
12    <title>Lab 6 - Task 6</title>
13  </head>
14  <body>
15    <h1>Passing data from main JSP's page to other JSP's page </h1>
16
17  </body>
18 </html>
```

14. Add additional HTML's tag and Java Scriptlet to retrieve the value from main's form.

```
16  <fieldset>
17  <%
18      //Define variables...
19      String myIC = null;
20      String myName = null;
21
22      //Use request.getParameter() method to retrieve data from main's form...
23      myIC = request.getParameter("my_icno");
24      myName = request.getParameter("my_name");
25  %>
26
27      <!-- Display the output... --&gt;
28      &lt;p&gt;Thank you for registering in this event..!&lt;/p&gt;
29      &lt;p&gt;This is your details:&lt;/p&gt;
30      &lt;p&gt;IC No : &lt;%=myIC%&gt;&lt;/p&gt;
31      &lt;p&gt;Name : &lt;%=myName%&gt;&lt;/p&gt;
32  &lt;/fieldset&gt;</pre>
```

15. Compile *memberProcessing.jsp* file.

16. Run the *memberRegister.jsp* file and fill-up the input.

17. Click *Submit* button to send the request.

18. These inputs will be sent to *memberProcessing.jsp* page and produce the following page.

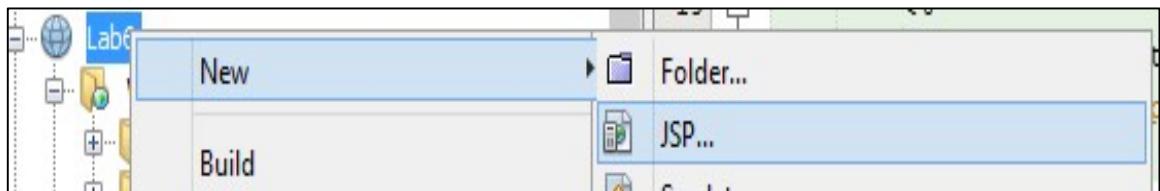

### Reflection

1. How do you want to submit specific information from one form to next form?
  
  
  
  
  
  
  
  
  
  
  
  
  
  
  
  
  
  
  
2. What happened if the field name you specify in `request.getParameter("field_name")` in second page is different from the field name you defined in first page?

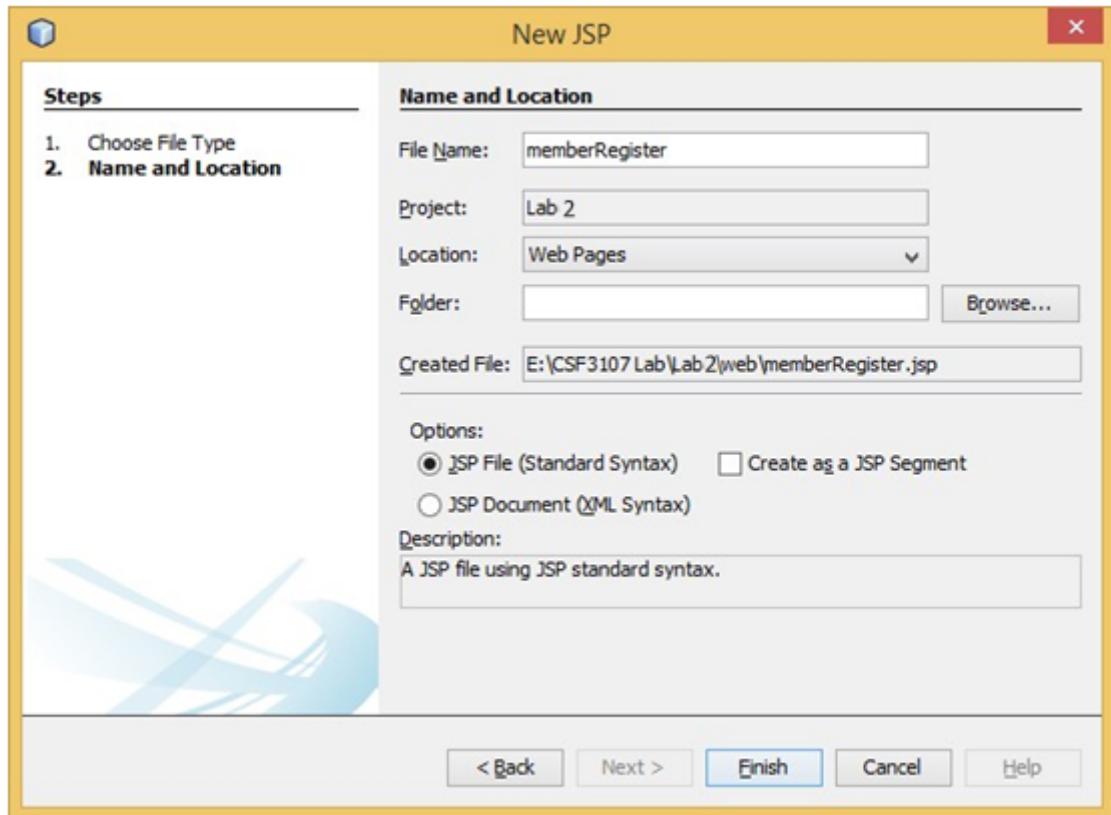

## Task 2: Using Mathematics Operations in JSP

<b>Objective</b>	: To demonstrate the use of <code>request.getParameter</code> (“Mathematics operations”) in JSP’s page.
<b>Problem Description</b>	: i. Create a page <code>Calculator.jsp</code> consists of interface represent basic calculator. ii. When user key-in inputs, process the request and display the results direct in JSP page.
<b>Estimated time</b>	: 30 minutes

1. Go to Project `Lab2`.
2. To create a JSP’s page, right click `Lab2` -> `New` -> `JSP`.

3. Key-in File Name: *Calculator*.

4. Click *Finish* button.

5. Source code for *Calculator.jsp* will appear.

6. Write a HTML's markup to produce HTML's form

```
<body bgcolor= "#a00fff" text= "gold">

<center>

<h2>Basic calculator program in JSP</h2>
<form method = "get" name = "f1">
<input type ="text" size = "20" name = "operand1" value = "" />

<select name = op size = 1>
<option value = "0" >+</option>
<option value = "1" >-</option>
<option value = "2" >*</option>
<option value = "3" >/</option>
<option value = "4" >%</option>
</select>

<input type ="text" size="20" name = "operand2" value = ""/>
<p><br><br><br><br>
<input type = submit value = Calculate />

</form>

</body>
```

7. Save and compile *Calculator.jsp* file.

8. Run the *Calculator.jsp* file and you should get the interface as below:

The screenshot displays a simple web form titled "Basic calculator program in jsp". It features two input fields, each containing the value "0". Between the fields is a dropdown menu with operators: +, -, \*, /, and %. The operator "+" is currently highlighted. Below the inputs is a "Calculate" button, and to its right is the text "Result = 0".

9. Add additional HTML's tag and Java scriptlet to retrieve the value from users.

```
<%
String num1 = "0", num2 = "0";
int result = 0;
String op = "+";

char opchar = op.charAt(0);
if (request.getParameter("op") != null){
op = request.getParameter("op");
opchar = op.charAt(0);

num1 = request.getParameter("operand1");
num2 = request.getParameter("operand2");

switch(opchar){
case '0': result = Integer.parseInt(num1) + Integer.parseInt(num2);
break;
case '1': result = Integer.parseInt(num1) - Integer.parseInt(num2);
break;
case '2': result = Integer.parseInt(num1) * Integer.parseInt(num2);
break;
case '3': result = Integer.parseInt(num1) / Integer.parseInt(num2);
break;
case '4': result = Integer.parseInt(num1) % Integer.parseInt(num2);
break;
}
}
%>

Result = <%= result + "" %>
```

9. Further, add additional Java Scriptlet to HTML's tag as below.

```
<body bgcolor= "#a00FFF" text= "gold">
<center>

<h2>Basic calculator program in jsp</h2>
<form method = "get" name ="f1">
<input type ="text" size ="20" name ="operand1" value = <%= num1 %> />

<select name = op size = 1>
<option value = "0" >+</option>
<option value = "1" >-</option>
<option value = "2" >*</option>
<option value = "3" >/</option>
<option value = "4" >%</option>
</select>

<input type ="text" size="20" name ="operand2" value = <%= num2 %> />
<p>
<input type = submit value = Calculate />

Result = <%= result + "" %>
</form>

</body>
</html>
```

10. Compile *Calculator.jsp* file.

11. Run the *Calculator.jsp* file and test the calculator.

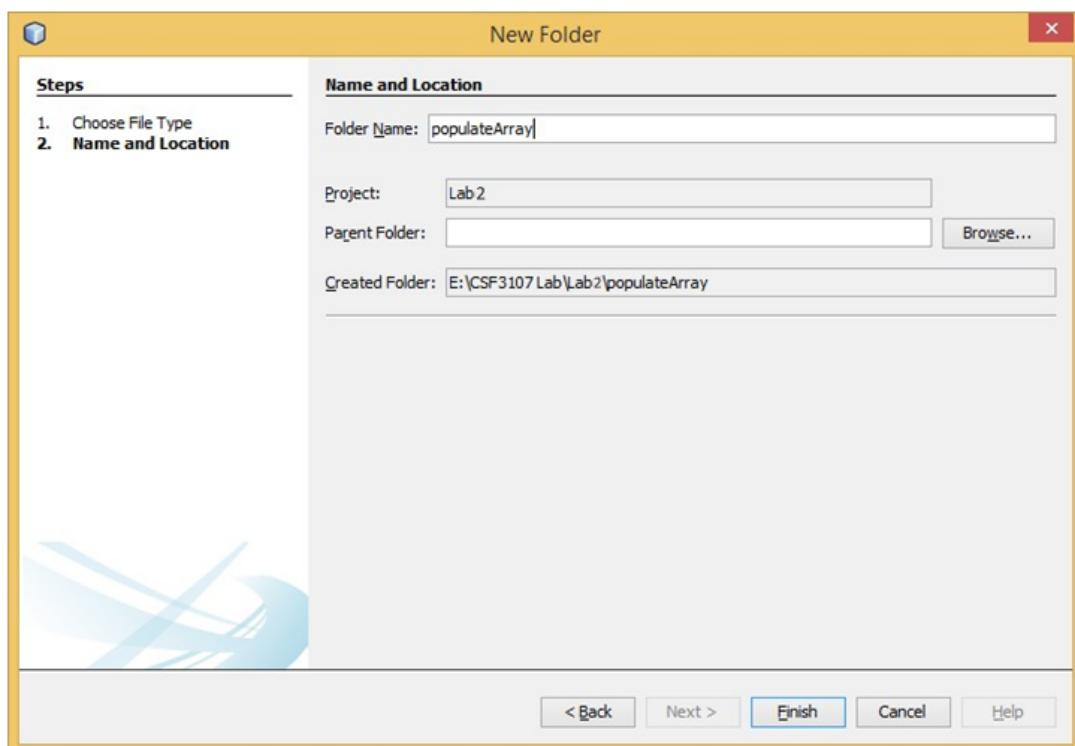

# Reflection

1. How do you want to submit specific information from one form to next form?
  2. What happened if the field name you specify in `request.getParameter("field_name")` in second page is different from the field name you defined in first page?

## Task 3: Populate an Array Values into HTML's Table

<b>Objective</b>	: Read Java array and populate it into HTML's table.
<b>Problem</b>	: i. Create 2D array that store sales data.
<b>Description</b>	ii. Then, read an array and populate into HTML's table.
<b>Estimated time</b>	: 50 minutes

1. Go to Project *Lab2*.
2. To create a JSP's page, right click *Lab2* -> *New* -> *JSP*.
3. Key-in File Name: *populateArray*.

4. Click *Finish* button.

5. Prepare standard HTML's a markup for page *populateArray.jsp*.
6. Write a Java Scriptlet and store the following information into an array;

	Jan	Feb	Mac
Salesman 1	2500	2100	2200
Salesman 2	2000	1900	2400
Salesman 3	1800	2200	2450

7. Read the array and populate its value into HTML's table.
8. Save and compile *populateArray.jsp* file.
9. Run the *populateArray.jsp* file and sample of output is shown below:

The screenshot shows a web browser window with the URL `localhost:8084/Lab2/populateArray.jsp` in the address bar. The page content is titled "Read Java array and populate it into HTML's table". Below the title is a table with four columns: Salesman, Jan, Feb, and Mac. The table contains three rows of data corresponding to the salesmen from the previous table. At the bottom left of the page, there is a copyright notice: "©2016-Mohamad Nor".

Salesman	Jan	Feb	Mac
Salesman 1	2500	2100	2200
Salesman 2	2000	1900	2400
Salesman 3	1800	2200	2450

## Reflection

1. Write a sample syntax to declare 2D Java array.
2. Define a sequence of steps on how you accomplish Task 7.
3. What is the difference between HTML's page and JSP's page

## Task 4: Perform Calculation of Car Loan

**Objective** : Passing input to next page for further processing.

**Problem** : i. Create simple interface in HTML that consists of Loan

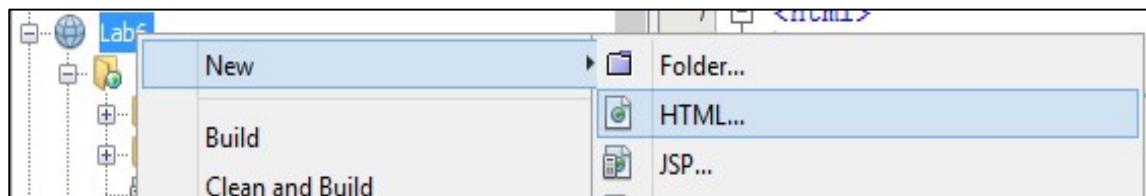

**Description** Amount and Loan Period. ( Loan Period < 5 years, interest is 2.8% per year, and > 5 years interest is 4.5% per year).

ii. Submit the form and perform calculation based on user input and, finally, display the result.

**Estimated time** : 50 minutes

1. Go to Project Lab2.

2. To create a HTML's page, right click Lab2 -> New -> JSP

3. Key-in File Name: *calculateCarLoan*

4. Create a standard HTML's markup for form.

5. In your form, create two (2) fields; *Loan Amount* and *Loan Period*.

6. Save *calculateCarLoan.html* and run the file.

7. You will get the following output.

The screenshot shows a web browser window with the URL `localhost:8084/Lab2/calculateCarLoan.html`. The page title is **Perform Car Loan Calculation**. Below the title, there is a form titled "Loan Calculation". The form has two input fields: "Loan Amount\*" with an empty input box and "Period" with a dropdown menu showing options: "3 years", "3 years" (which is highlighted in blue), "4 years", "5 years", and "7 years". Below the form are two buttons: "Submit" and "Cancel". At the bottom of the page, there is a copyright notice: ©2016-Mohamad Nor.

8. Create JSP's file and rename the file as *processCalculateCarLoan*.

9. Construct the logic for calculating car loan and display the result.

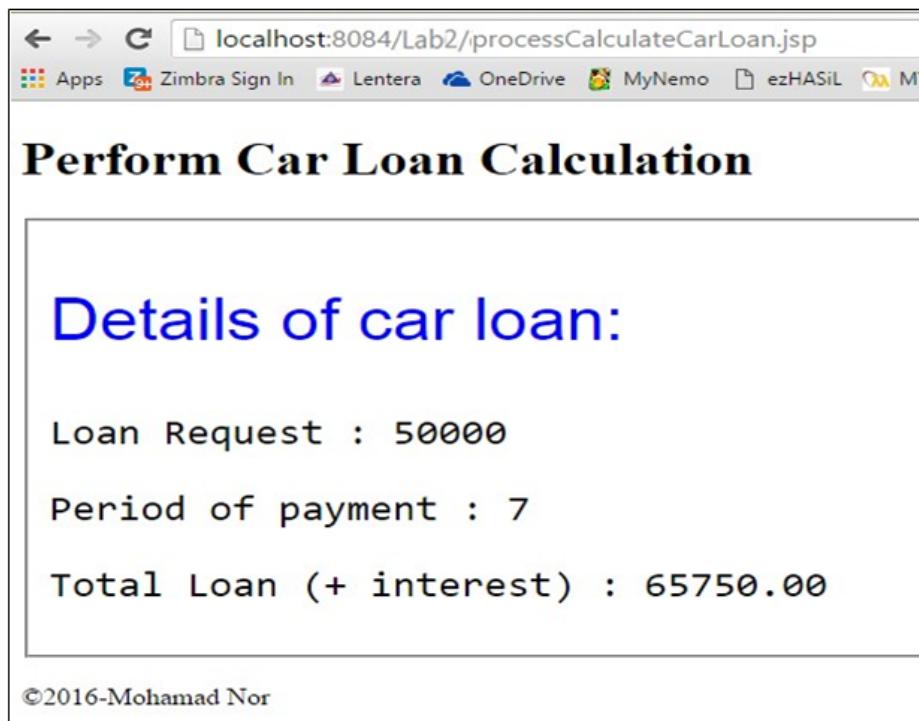

10. Save and compile *processCalculateCarLoan.jsp*.

11. Run *calculateCarLoan.html* file and fill-up the input.

12. Then, submit your result.

13. You should get the following output;

The screenshot shows a web browser window with the URL `localhost:8084/Lab2/calculateCarLoan.html`. The page title is **Perform Car Loan Calculation**. Below the title, there is a form titled "Loan Calculation". The "Loan Amount\*" field contains the value "50000" and the "Period" dropdown menu shows "7 years". Below the form are two buttons: "Submit" and "Cancel". At the bottom of the page, there is a copyright notice: ©2016-Mohamad Nor.

### Reflection

1. How you want to retrieve data from previous page?
2. Where the construction of logic occur for calculating Total Loan ( + interest) ?

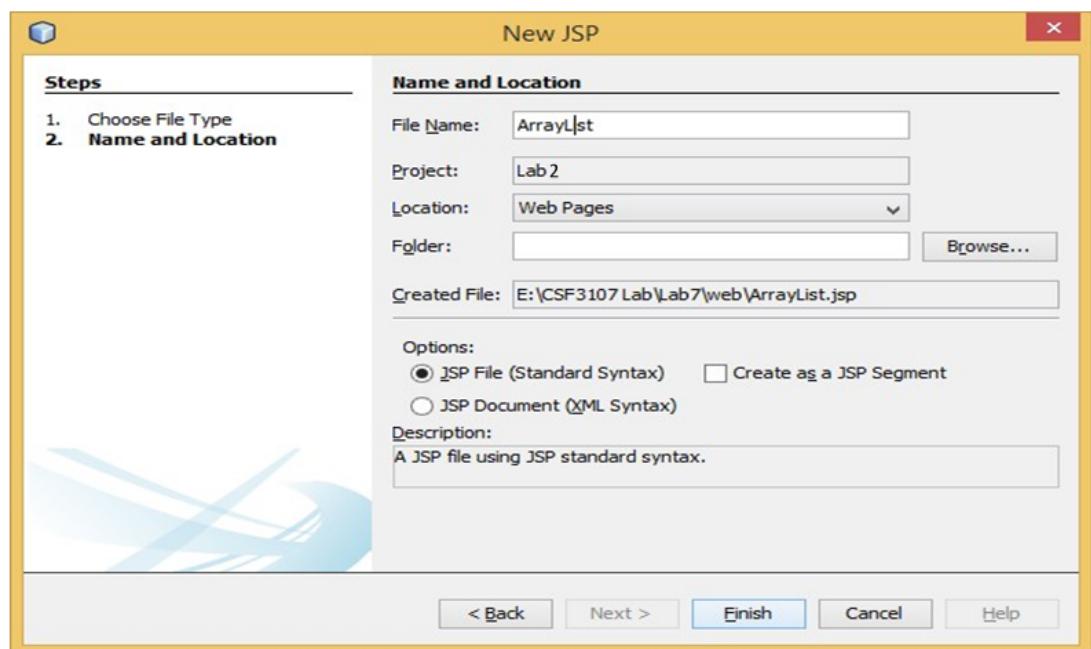

## Task 5: Using JSP Page Directive to Call Java API

<b>Objective</b>	: Use JSP page directive elements to call certain Java API.
<b>Problem</b>	: Using Java <i>ArrayList</i> object to store data and retrieve it via JSP page.
<b>Description</b>	
<b>Estimated time</b>	: 20 minutes

1. Create a new JSP's file.

2. Type file name as *ArrayList*.

2. Click *Finish* button.

4. Type title as *Use Java ArrayList*.

5. Type header1 as *Use JSP Page Directive*

```
1  <%--  
2   Document      : ArrayList  
3   Created on   : 10-Apr-2016, 09:24:46  
4   Author        : Mohamad Nor Hassan  
5 --%>  
6  
7  <%@page contentType="text/html" pageEncoding="UTF-8"%>  
8  <!DOCTYPE html>  
9  <html>  
10 <head>  
11  <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">  
12  <title>Use Java ArrayList</title>  
13 </head>  
14 <body>  
15  <h1>Use JSP Page Directive</h1>  
16 </body>  
17  <br/>  
18  <footer>&copy2016-Mohamad Nor</footer>  
19 </html>
```

6. In order to use Java *ArrayList*'s object, we need to use JSP Page Directive and import the related API.

```
7  <%@page contentType="text/html" pageEncoding="UTF-8"%>  
8  <%@page import="java.util.ArrayList"%>
```

7. In order to use Java syntax, create a Java Scriptlet notation.

```
15 <body>  
16  <h1>Use JSP Page Directive</h1>  
17  <%  
18  %>  
19 </body>  
20
```

8. Create an object *ArrayList* to store a list of student name.

```
17 <%  
18  //Create ArrayList object ...  
19  ArrayList<String> studentList = new ArrayList<String>();  
20 %>
```

9. Add the following name to ArrayList's object.

- ✓ Mohamad Azam
- ✓ Peter Chong
- ✓ Rahimah Mansor
- ✓ Sri Devi
- ✓ Ng Hue Ween
- ✓ S. Nagarajan

```
21 |           //Store student name..  
22 |           studentList.add(0, "Mohamad Azam");  
23 |           studentList.add(1, "Peter Chong");  
24 |           studentList.add(2, "Rahimah Mansor");  
25 |           studentList.add(3, "Sri Devi");  
26 |           studentList.add(4, "Ng Hue Ween");  
27 |           studentList.add(5, "S. Nagarajan");
```

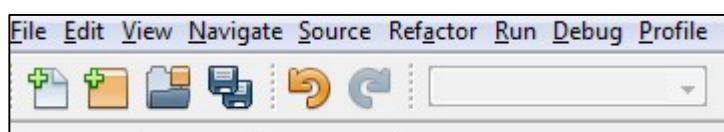

10. Display the number of records for an ArrayList's object.

```
29 |           //Display the number of records..  
30 |           out.println("<p>The number of records in ArrayList are " +  
31 |                           studentList.size() + "</p>");
```

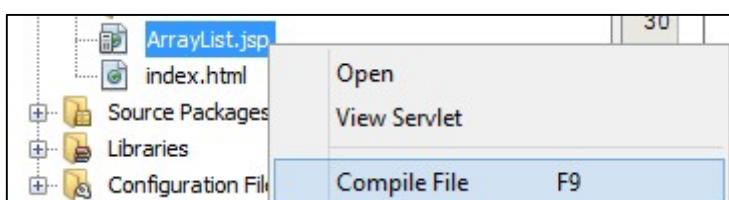

11. Finally, populate the list of students.

```
39 |           //Populate a list of students...  
40 |           for (int i=0; i < studentList.size(); i++ )  
41 |               out.println("<p>Record " + (i+1) + " is " + studentList.get(i) + "</p>");
```

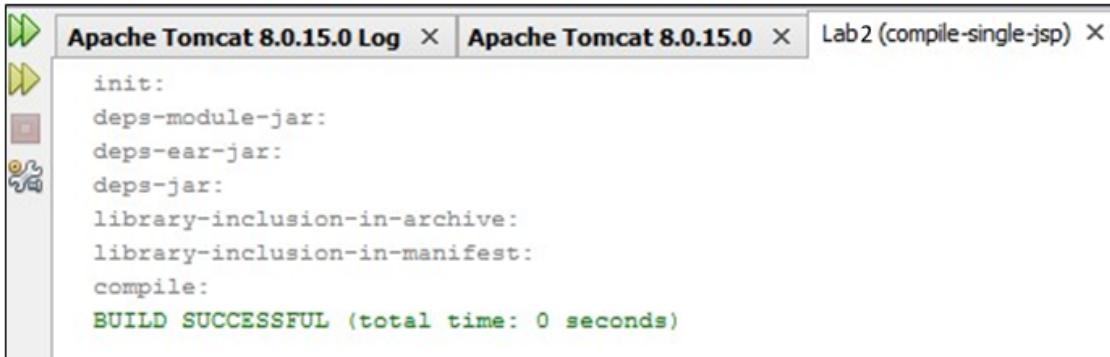

12. Click *SaveAll* icon.

13. Right click file *ArrayList.jsp* and click *Compile File* (F9).

14. You will get notification message at the bottom of Netbeans IDE with the green colour.

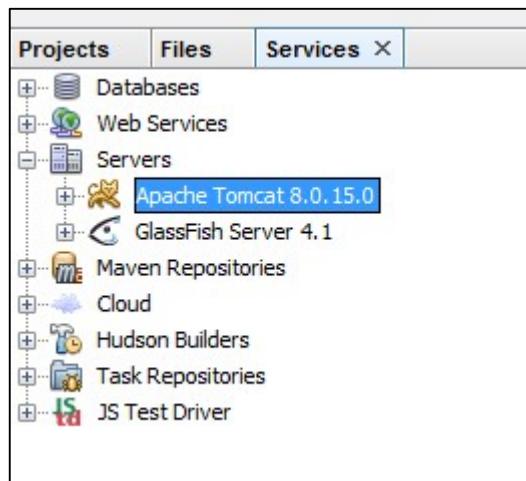

The screenshot shows the Apache Tomcat 8.0.15.0 Log window in Netbeans. The log output is as follows:

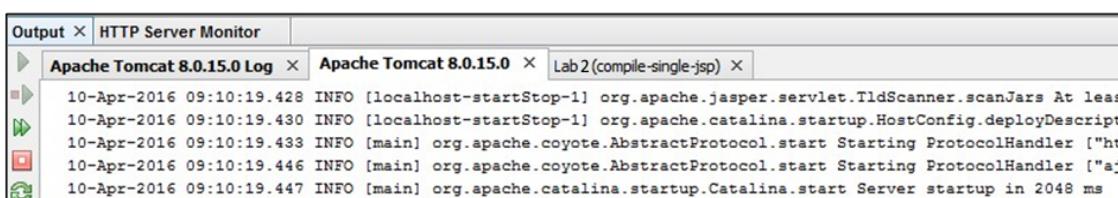

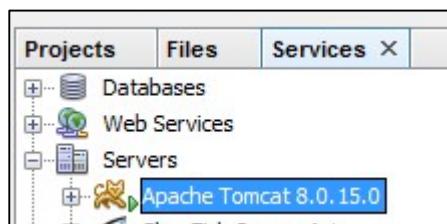

```
init:  
deps-module-jar:  
deps-ear-jar:  
deps-jar:  
library-inclusion-in-archive:  
library-inclusion-in-manifest:  
compile:  
BUILD SUCCESSFUL (total time: 0 seconds)
```

15. Before running any JSP's files for first time upon opening your Netbeans IDE, you need to start your web server (i.e; Apache Tomcat).

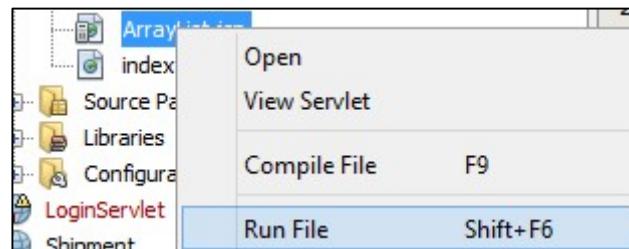

16. To perform this, go to *Services* -> *Servers* -> *Apache Tomcat*.

17. You should get the green indicator at *Apache Tomcat*'s icon and *Apache Tomcat* output message with the time taken to start specified time to start *Apache Tomcat* web server.

18. Go to Project's tab. Then right click file *ArrayList.jsp* and click *Run File* (Shift+F6).

19. Output will appear in web browser.

A screenshot of a web browser window titled "Use Java ArrayList". The address bar shows the URL "localhost:8084/Lab2/ArrayList.jsp". The main content area displays the following text:

**Use JSP Page Directive**

The number of records in ArrayList are 6

Record 1 is Mohamad Azam

Record 2 is Peter Chong

Record 3 is Rahimah Mansor

Record 4 is Sri Devi

Record 5 is Ng Hue Ween

Record 6 is S. Nagarajan

At the bottom of the page, there is a copyright notice: ©2016-Mohamad Nor

## Reflection

1. What you have learnt from this exercise?
  2. Write a sample syntax how you want to use java *Math* object in JSP?
  3. List and write a sample syntax for THREE (3) of JSP page directive.

## Task 6: Use JSP Include directive for JSP Page

**Objective** : Demonstrate the use of JSP Page Include directive.

**Problem** : Create a JSP master page that displays the header, main contents and footer.

**Description**

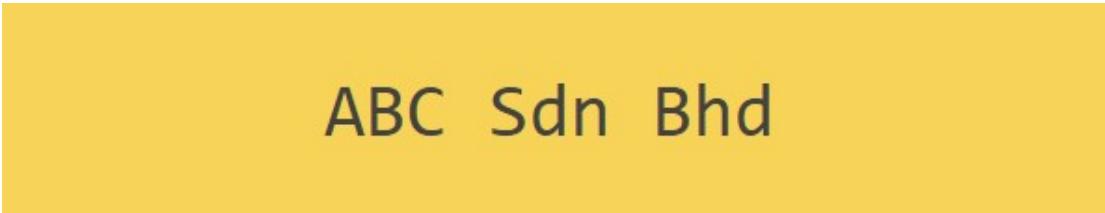

**Estimated time** : 30 minutes

1. Create a new JSP's file.
2. Type file name as *mainPage*.
3. Create content for *mainPage.jsp* as below.

### Using JSP Include directive

Java Server Page (JSP) is a technology for controlling the content or appearance of Web pages through the use of servlets, small programs that are specified in the Web page and run on the Web server to modify the Web page before it is sent to the user who requested it.

4. Create a header file as *headerPage.jsp* and display the following output.

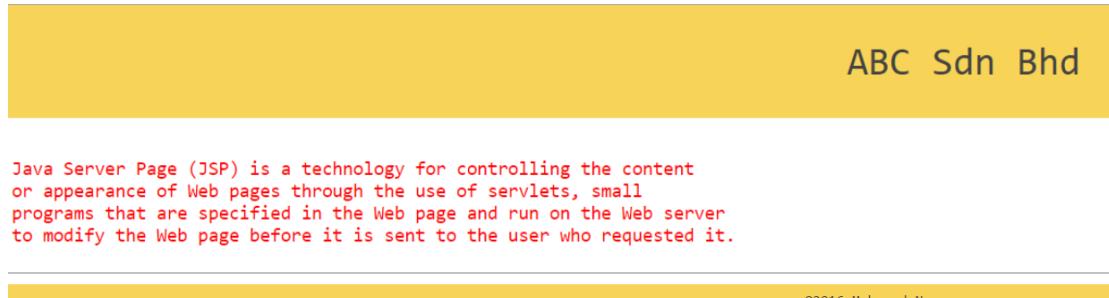

ABC Sdn Bhd

5. Create a header file as *footerPage.jsp* and display the following output

©2016-Mohamad Nor

6. Include your *headerPage.jsp* and *footerPage.jsp* inside your *mainPage.jsp*.
7. Save *mainPage.jsp*
8. Compile and run *mainPage.jsp*.
9. You should get the following output.

## Reflection

1. What you have learnt from this exercise?
2. Write a syntax how you want to include *common.html* file that located at a directory known as *master*.

## **Exercise**

1. Write a JSP's page to convert temperatures to Fahrenheit temperatures and via versa. The formula is given as:

$$F = (9/5)C + 32$$

Your program should ask the user to enter a temperature in Celsius, and then display the temperature converted to Fahrenheit.

2. Write a JSP's form that asks for the length and width of two rectangles. The program should tell the user which rectangle has the greater area, or if the areas are the same. [Note: All result must be in 2 decimal places].
